What We Want You To Know About Advanced Biofilm Care.

What is HybenX ?

At Cornerstone and Civic Dental, we use HybenX[®], a professionally applied, non-antibiotic gel. It is designed to target and eliminate harmful bacteria (biofilm) beneath the gumline, helping treat gum disease and reduce inflammation around natural teeth and dental implants.

How does it work?

Your dental professional carefully applies HybenX[®] directly into the areas of concern. This quick and targeted treatment uses Desiccation Shock Technology (DST), which works by dehydrating harmful bacteria, effectively eliminating them.

What are the benefits?

- **Efficiency:** It works in as little as 30 seconds by eradicating harmful bacteria to allow good bacteria to repopulate. Benefits of this process have been observed for *up to a year* after treatment.
- **Greater Comfort:** It helps soften hard buildup (tartar), allowing our team to remove it more efficiently.
- **Better Results:** By “resetting” the oral environment, it supports faster gum healing and improved treatment outcomes.
- **Non-Invasive:** As a non-antibiotic treatment, HybenX[®] carries no risk of antibiotic resistance.

What should I expect?

You may feel a brief, mild tingling sensation as HybenX[®] begins to work. A temporary sour taste is normal and will be rinsed away after the application. Many patients have little to no discomfort. The treated tissue may appear white for up to 24 hours, which is a normal part of the process.

Thank you, and if there are any questions or concerns, please don't hesitate to call the office.
